

## Overview

There seems to be issues with creating XPe components for the latest NVIDIA drivers. The solution is to create an installer component, which will run a silent install during FBA. The SLD provides an example of how to do this.

## SLD Instructions:

1. **Download Install** the latest NVIDIA video driver.
2. Run the NVIDIA installer EXE to extract the driver installation files, but cancel the start of the installation.
3. Copy the installation files to a flat directory.
4. **Download** the ZIP file containing the SLD.
5. **Extract** the contents of the ZIP file to your hard drive.
6. Open the SLD and change the Repository directory to point to the path of the flat release directory containing the files.
7. **Import** the SLD into the XPe data base using Component Database Manager.
